Abstract: Advances in veterinary medicine using modern techniques. Replacement missing teeth with dental implants appears to be an example of this technique is. Many veterinarians working in dentistry, dental implants feel the same way that is useful to humans can be useful for pets. Replacement of missing teeth from shifting teeth adjacent to the space created. Also prevent the destruction of the jaw implant prevents chewing is impaired. One of the major benefits of dental implants is its beauty, but it is more complicated in pets is very little evidence that proves some argue that dental implants in animals is safe or effective in improving their lives. Laboratory studies on dogs and other words of dental implants in animals have not been tested with real-life experiences as well as short-term main. Profit dental implants in dogs, prevention is the destruction of the lower jaw. Other advantages of implants in animals, ensuring the health of adjacent teeth, chew food easily, limiting the movement of the teeth and prevent tooth root adjacent protrusions. Another advantage of implants is very important in pet’s luxury, appearance of the dog.
